

ABSTRACT OF THE DISCLOSURE

A multi-segment container comprises identical segments hinged together and forming an enclosure, the segment side walls having detent hinges for detachable engagement with adjoining segments. The detent hinges are located on flexible tab portions located externally of the container as side wall extensions. A three-segment embodiment forms a cylindrical container with flat side portions having raised area portions to serve as abutment stops for adjoining segments. The segments can be used singly or arranged in a variety of displays, and the container can serve as a CD case with separation grooves for the individual discs, or be used as an open display.
